BESCHREIBUNG - EINLEITUNG

Wellendichtringe

Der Wellendichtring verhindert als Radial-Wellendichtung das Austreten von Schmiermitteln und flüssiger Medien und das Eindringen betriebsfremder Stoffe.

Begriffe nach DIN 3761 (Entwurf)

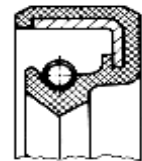

Wellendichtringe sind Dichtelemente der Gruppe der Rotationsdichtungen, bei denen sich die eine abdichtende Fläche gegenüber der anderen dreht. Prinzipiell sind alle Wellendichtringe nur gegen drucklos fließende Medien einsetzbar, nur in Ausnahmefällen durch den Einbau zusätzlicher Stützringe für Betriebsdruck bis 5 bar geeignet. Der Einbau erfolgt üblicherweise durch Einpressen in eine axial offene Nut.

Die wichtigsten Bauformen

Bauform A

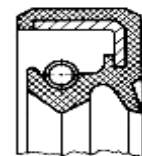

Ausführung gemäss DIN 3760 Form A.

Der Aussenmantel aus einem Elastomerwerkstoff ermöglicht einen festen Sitz in der Aufnahmebohrung und kann wärmeausdehnungen des Gehäuses besser kompensieren. Durch den elastischen Aussenmantel werden Verletzungen der Gehäusebohrung während der Montage eher vermieden. Diese Form ist in nahezu allen üblichen Abmessungen in NBR-(Nitril) und FPM-(Viton) Elastomeren lieferbar.

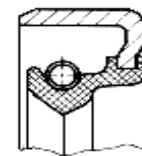

Bauform BASL

Ausführung und Einsatz im Prinzip wie Bauform A, jedoch zusätzlich mit einer Staubschutzlippe ausgerüstet. Diese Bauform empfiehlt sich überall dort, wo der Dichtring mit Sand, Staub, Schmutz usw. in Berührung kommt.

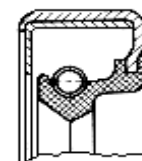

Bauform B1

Diese Bauform hat einen metallischen Aussenmantel, auf welchem die Dichtlippe direkt aufvulkanisiert ist. Die Abdichtung ist bei hoher Wärmedehnung des Gehäuses schwieriger als bei den vorgängig beschriebenen Typen.

Bauform B2

Radial-Wellendichtring mit geschlossenem Metall-Aussenmantel. Die zusätzliche Kappe dient als Versteifung, weshalb diese Bauform bei grösseren Abmessungen bevorzugt eingesetzt wird.

Weitere Bauformen:

* Doppel-Wellendichtringe sind nur noch in ganz seltenen Fällen lieferbar.
